Interaction Diagrams

Sequence Diagram (fig. 7)

(Pencil, bitches!)

Communication Diagram (fig. 8)

(Pencil, bitches!)

Reflection on the advantages and disadvantages of respectively sequence and communication diagrams: Sequence diagrams have a more rich notation, which is reflected by the rather ugly loop-inside-a-conditional syntax used with message 1.1. Although it seems like most of the missing notations could rather easily be adapted directly as they are for sequence diagrams. Communication diagrams are easily extended and rewritten, as they do not have the strict "left to right" structure of sequence diagrams. In turn, that might make them harder to assess. In our opinion, communication

diagrams can be drawn much quicker than sequence diagrams. That might sound like the argument of a lazy person, but it might make the difference between making/updating a diagram, or just abandoning the documentation.
